

4. This question involves a two-dimensional array of integers that represents a collection of randomly generated data. A partial declaration of the `Data` class is shown. You will write two methods of the `Data` class.

```
public class Data
{
    public static final int MAX = /* value not shown */;
    private int[][] grid;

    /** Fills all elements of grid with randomly generated values, as described in part (a)
     * Precondition: grid is not null.
     * grid has at least one element.
     */
    public void repopulate()
    { /* to be implemented in part (a) */ }

    /** Returns the number of columns in grid that are in increasing order, as described
     * in part (b)
     * Precondition: grid is not null.
     * grid has at least one element.
     */
    public int countIncreasingCols()
    { /* to be implemented in part (b) */ }

    // There may be instance variables, constructors, and methods that are not shown.
}
```

GO ON TO THE NEXT PAGE.

- (a) Write the `repopulate` method, which assigns a newly generated random value to each element of `grid`. Each value is computed to meet all of the following criteria, and all valid values must have an equal chance of being generated.
- The value is between 1 and `MAX`, inclusive.
 - The value is divisible by 10.
 - The value is not divisible by 100.

Complete the `repopulate` method.

```
/** Fills all elements of grid with randomly generated values, as described in part (a)
 *   Precondition: grid is not null.
 *   grid has at least one element.
 */
public void repopulate()
```

GO ON TO THE NEXT PAGE.

- (b) Write the `countIncreasingCols` method, which returns the number of columns in `grid` that are in increasing order. A column is considered to be in increasing order if the element in each row after the first row is greater than or equal to the element in the previous row. A column with only one row is considered to be in increasing order.

The following examples show the `countIncreasingCols` return values for possible contents of `grid`.

The return value for the following contents of `grid` is 1, since the first column is in increasing order but the second and third columns are not.

| | | |
|----|----|----|
| 10 | 50 | 40 |
| 20 | 40 | 20 |
| 30 | 50 | 30 |

The return value for the following contents of `grid` is 2, since the first and third columns are in increasing order but the second and fourth columns are not.

| | | | |
|-----|-----|-----|-----|
| 10 | 540 | 440 | 440 |
| 220 | 450 | 440 | 190 |

Complete the `countIncreasingCols` method.

```
/** Returns the number of columns in grid that are in increasing order, as described
 *   in part (b)
 *   Precondition: grid is not null.
 *   grid has at least one element.
 */
public int countIncreasingCols()
```
